## 单点登录系统介绍

• 传统的登录

```
用户名:
                                    密码:
                                                                     提交
• servlet中处理
  String name = request.getParameter("username");
  String passwd = request.getParameter("passwd");
  User user = new User();
  user.setName(name);
  user.setPassword(passwd);
  if("jack".equals(name) && "123".equals(passwd)){
  request.getSession().setAttribute("user",user);
  response.getWriter().print("登陆成功");
  }else{
  response.getWriter().print("用户名或密码有误");
  response.getWriter().flush();
  index.jsp得到页面返回数据
```

taotao-project登录系统

```
//注册时保存密码
public Boolean saveUser(User user) {
   user.setId(null);
   user.setCreated(new Date());
   user.setUpdated(user.getCreated());
   // 密码通过MD5进行加密处理
   user.setPassword(DigestUtils.md5Hex(user.getPassword()));
   return this.userMapper.insert(user) == 1;
登录时doLogin
@RequestMapping(value="doLogin", method=RequestMethod.POST)
   @ResponseBody
   public Map<String,Object> doLogin(@RequestParam("username") String usernam
е,
           @RequestParam("password") String password,HttpServletRequest reque
st,HttpServletResponse response){
       Map<String,Object> result = new HashMap<>();
       try{
           String token = this.userService.doLogin(username,password);
           if(null == token){
               //登陆失败
               result.put("status", 400);
           }else{
               //登陆成功
               result.put("status", 200);
               CookieUtils.setCookie(request, response, COOKIE_NAME, token);
       }catch(Exception e){
           e.printStackTrace();
           // 登录失败
           result.put("status", 500);
       return result;
//userService中的doLogin()
public String doLogin(String username, String password) throws Exception {
   User record = new User();
   record.setUsername(username);
   User user = this.userMapper.selectOne(record);
   if (null == user) {
       return null;
   // 比对密码是否正确
   if (!StringUtils.equals(DigestUtils.md5Hex(password), user.getPassword()))
       return null;
   // 登录成功
   // 生成token
   String token = DigestUtils.md5Hex(System.currentTimeMillis() + username);
   // 将用户数据保存到redis中MAPPER.writeValueAsString(user),数据会保存成json
   this.redisService.set("TOKEN_" + token, MAPPER.writeValueAsString(user), 6
```

这样下次用户每次进入首页都会调用queryUsertByToken()方法去查找用户名。

```
public User queryUerByToken(String token){
String key = "TOKEN_"+token;
String jsonData = this.redisService.get(key);
if(StringUtils.isEmpty(jsonData)){
    return null;
}

try{
    //—且查找到token,就表示用户再次登录,需要刷新用户的生存时间
    this.redisService.expire(key, 60*30);
    return MAPPER.readValue(jsonData, User.class);
    //把json数据封装成user对象
}catch(Exception e){
    e.printStackTrace();
}
return null;
}
```

### 使用拦截器实现用户是否登录的校验 //使用springmvc中拦截器验证用户是否登录

```
public class UserLoginHandlerInterceptor implements HandlerInterceptor {
public static final String COOKIE_NAME = "TT_TOKEN";
@Autowired
private PropertieService propertieService;
@Autowired
private UserService userService;
@Override
public boolean preHandle(HttpServletRequest request, HttpServletResponse respo
nse, Object handler)
       throws Exception {
    UserThreadLocal.set(null);//清空当前线程中的User对象
    String loginUrl = propertieService.TAOTAO_SSO_URL + "/user/login.html";
    String token = CookieUtils.getCookieValue(request, COOKIE_NAME);
    if (StringUtils.isEmpty(token)) {
        response.sendRedirect(loginUrl);
       return false;
    User user = this.userService.queryUserByToken(token);
    if (null == user) {
        response.sendRedirect(loginUrl);
    UserThreadLocal.set(user); //将User对象放置到ThreadLocal中
@Override
public void postHandle(HttpServletRequest request, HttpServletResponse respons
e, Object handler,
        ModelAndView modelAndView) throws Exception {
@Override
public void afterCompletion(HttpServletRequest request, HttpServletResponse re
sponse, Object handler,
        Exception ex) throws Exception {
```
